

## Abstract

### CABLE RESTRAINING DEVICE

- 5           A detachable binding device ~~comprising~~<sup>with</sup> a bracket including a base portion and a slotted projection having a first slot and a second slot aligned in parallel with the first slot between the first slot and the base portion. The binding device further includes a self-gripping fastening strip. The fastening strip passes through the first slot to form a first wrap around a length of a cable to hold the cable against the slotted projection. The
- 10   fastening strip then passes through the second slot to form a second wrap over the first wrap and the length of the cable for secure retention of the cable against the slotted projection by setting the fastening strip into a self-gripping arrangement. After formation, the binding device may be detached from the length of the cable and the bracket by
- 15   disrupting the self-gripping arrangement of the fastening strip and withdrawing the fastening strip from the second slot and the first slot to release the length of the cable from contact with the slotted projection.
